PREFACE

This report documents the conformity assessment of an Ada processor. This assessment was conducted in accordance with the Ada Conformity Assessment Procedures of the Ada Conformity Assessment Laboratory (ACAL) named below and with the Ada Conformity Assessment Authority Operating Procedures, Version 2.0. The Ada Conformity Assessment Test Suite (ACATS), Version 2.2, was used for testing; the specific version identification is given below.

The successful completion of conformity assessment is the basis for the issuance of a certificate of conformity and for subsequent registration of related processors. A copy of the certificate A991113E2.2-001 which was awarded for this assessment is presented on the following page. Conformity assessment does not ensure that a processor has no nonconformities to the Ada standard other than those, if any, documented in this report. The compiler vendor declares that the tested processor contains no deliberate deviation from the Ada standard; a copy of this Declaration of Conformity is presented immediately after the certificate.

Base Test Suite Version	ACATS 2.2 (VCS label A2_2F) (See Section 2.2 for details)
Location of Testing	DDC-I A/S Gl. Lundtoftevej 1B DK-2800 Lyngby, Denmark
Test Completion Date	16 November 1999

This report has been reviewed and approved by the signatories below. These organizations attest that, to the best of their knowledge, this report is accurate and complete; however, they make no warrant, express or implied, that omissions or errors have not occurred.

ACATS Version: 2.2

Ada Processor

Ada Compiler Name and Version: DDC-I SCORE Ada 95 Compiler System,
Version 1.0A, Sparc/Solaris

Host Computer System: UltraSPARC5
Solaris, 2.5.1

Target Computer System: Same as host

Declaration

I, the undersigned, declare that I have no knowledge of deliberate deviations from the Ada Language Standard ANSI/ISO/IEC 8652:1995, other than the omission of features as documented in this Ada Conformity Assessment Test Report.

Date

CHAPTER 1

INTRODUCTION

The Ada processor described above was tested in accordance with the Ada Conformity Assessment Procedures [ACAP] (Language Processor Validation Procedures) of the ACAL and with Version 2.0 of the Operating Procedures of the ACAA [Pro99]. Testing was accomplished using Version 2.2 of the Ada Conformity Assessment Test Suite (ACATS), also known as the Ada Compiler Validation Capability (ACVC). The ACATS checks the conformity of an Ada processor to the Ada Standard [Ada95].

This Ada Conformity Assessment Test Report (ACATR) gives an account of the testing of this Ada processor. For any technical terms used in this report, the reader is referred to [Pro99]. A detailed description of the ACATS may be found in the ACVC User's Guide [UG98].

1.1 USE OF THIS REPORT

Consistent with the national laws of the originating country, the ACAL and ACAA may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). Certified status is awarded only to the processor identified in this report. Copies of this report are available to the public from the ACAL that performed this conformity assessment. Copies are also available online at the Ada Information Clearinghouse Web site (www.adaic.org).

Questions regarding this report or the test results should be directed to the ACAL which performed this conformity assessment or to the Ada Conformity Assessment Authority. For all points of contact, see Appendix B.

INTRODUCTION

1.2 TEST CLASSES

Compliance of Ada processors is tested by means of the ACATS. The ACATS contains a collection of test programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable. Class B and most Class L tests are expected to produce errors at compile time and link time, respectively.

The executable tests are written in a self-checking manner and produce a PASSED, FAILED, or NOT APPLICABLE message indicating the result when they are executed. Three Ada library units, the packages REPORT and SPRT13, and the procedure CHECK_FILE are used for this purpose. The package REPORT also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The package SPRT13 contains constants of type SYSTEM.ADDRESS. These constants are used by selected Section 13 tests and by isolated tests for other sections. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for the Input-Output features of the Ada Standard, defined in Annex A of [Ada 95]. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. If these units are not operating correctly, conformity testing is discontinued.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that all violations of the Ada Standard are detected. Some of the Class B tests contain legal Ada code which must not be flagged illegal by the compiler. This behavior is also verified.

Class L tests check that an Ada processor correctly detects violation of the Ada Standard involving multiple, separately compiled units. In most Class L tests, errors are expected at link time, and execution must not begin. Other L tests may execute and report the appropriate result.

For some tests of the ACATS, certain implementation-specific values must be supplied. Two insertion methods for the implementation-specific values are used: a macro substitution on the source file level of the test, and linking of a package that contains the implementation-specific values. Details are described in [UG98]. A list of the values used for this processor, along with the specification and body of the package (and children applicable to any of Specialized Needs Annexes being tested) are provided in Section 3.2 of this report.

In addition to these anticipated test modifications, changes may be required to remove unforeseen conflicts between the tests and implementation-dependent characteristics. The modifications required for this processor are described in Section 2.2.

For the conformity assessment of each Ada processor, a customized test suite is produced by the ACAL. This customization consists of making the modifications described in the preceding paragraph, removing withdrawn tests (see Section 2.1), and possibly removing some inapplicable tests (see Section 2.1 and [UG98]).

1.3 DEFINITION OF TERMS

Acceptable result	A result that is explicitly allowed by the grading criteria of the test program for a grade of passed or inapplicable.
Ada compiler	The software and any needed hardware that have to be added to a given host and target computer system to allow transformation of Ada programs into executable form and execution thereof.
Ada Compiler Validation Capability	The means of checking conformity of Ada processors, consisting of tests, support programs, and a User's Guide. Also referred to as the Ada Conformity Assessment Test Suite.
Ada Conformity Assessment Test Suite (ACATS)	Alternate name for the ACVC (which see).
Ada Conformity Assessment Laboratory	An organization which carries out the procedures required to assess the conformity of an Ada processor.
Ada Conformity Assessment Authority (ACAA)	The organization that provides coordination and technical guidance for the Ada Conformity Assessment Laboratories.
Ada Implementation	An Ada processor running on a particular configuration.
Ada Processor	A processor for the Ada programming language as defined in [Ada95].
Certified Status	(Also "certified as conforming") The status granted to an Ada processor by the award of an Ada Conformity Assessment Certificate.
Computer System	A functional unit, consisting of one or more computers and associated software, that uses common storage for all or part of a program and also for all or part of the data necessary for the execution of the program; executes user-written or user-designated programs; performs user-designated data manipulation, including arithmetic operations and logic operations; and that can execute programs that modify themselves during execution. A computer system may be a

INTRODUCTION

stand-alone unit or may consist of several inter-connected units.

Configuration A specific host and target system. "Configuration" is usually used along with "processor" to completely specify a conformity assessment.

Conformity Fulfillment by a product, process or service of all requirements specified.

Unsupported Feature Test A test for a language feature that is not required to be supported, because it is based upon a requirement stated in an Ada 95 Specialized Needs Annex.

Withdrawn Test A test found to be incorrect and not used in conformity testing. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains erroneous or illegal use of the Ada programming language.

CHAPTER 2

IMPLEMENTATION DEPENDENCIES

2.1 INAPPLICABLE TESTS

A test is inapplicable if it contains test objectives which are irrelevant for a given Ada processor. Reasons for a test's inapplicability may be supported by documents issued by the ISO known as Ada Commentaries and commonly referenced in the format AI95-ddddd. For this processor, the following tests were determined to be inapplicable for the reasons indicated; references to Ada Commentaries are included as appropriate.

C45531M..P and C45532M..P (8 tests) check fixed-point operations for types that require a `SYSTEM.MAX_MANTISSA` of 47 or greater; for this processor, `MAX_MANTISSA` is less than 47.

C45624A..B (2 tests) check that the proper exception is raised if `MACHINE_OVERFLOW`s is `FALSE` for floating point types and the results of various floating-point operations lie outside the range of the base type; for this processor, `MACHINE_OVERFLOW`s is `TRUE`.

C96005B uses values of type `DURATION`'s base type that are outside the range of type `DURATION`; for this processor, the ranges are the same.

The tests listed in the following table check that `USE_ERROR` is raised if the given file operations are not supported for the given combination of mode and access method; this processor supports these operations.

Test	File Operation	Mode	File Access Method
CE2102D	CREATE	IN_FILE	SEQUENTIAL_IO
CE2102E	CREATE	OUT_FILE	SEQUENTIAL_IO
CE2102F	CREATE	INOUT_FILE	DIRECT_IO
CE2102I	CREATE	IN_FILE	DIRECT_IO
CE2102J	CREATE	OUT_FILE	DIRECT_IO
CE2102N	OPEN	IN_FILE	SEQUENTIAL_IO
CE2102O	RESET	IN_FILE	SEQUENTIAL_IO
CE2102P	OPEN	OUT_FILE	SEQUENTIAL_IO
CE2102Q	RESET	OUT_FILE	SEQUENTIAL_IO
CE2102R	OPEN	INOUT_FILE	DIRECT_IO

IMPLEMENTATION DEPENDENCIES

CE2102S	RESET	INOUT_FILE	DIRECT_IO
CE2102T	OPEN	IN_FILE	DIRECT_IO
CE2102U	RESET	IN_FILE	DIRECT_IO
CE2102V	OPEN	OUT_FILE	DIRECT_IO
CE2102W	RESET	OUT_FILE	DIRECT_IO
CE3102E	CREATE	IN_FILE	TEXT_IO
CE3102F	RESET	Any Mode	TEXT_IO
CE3102G	DELETE	-----	TEXT_IO
CE3102I	CREATE	OUT_FILE	TEXT_IO
CE3102J	OPEN	IN_FILE	TEXT_IO
CE3102K	OPEN	OUT_FILE	TEXT_IO.

CE2203A checks that WRITE raises USE_ERROR if the capacity of an external sequential file is exceeded; this processor cannot restrict file capacity.

CE2403A checks that WRITE raises USE_ERROR if the capacity of an external direct file is exceeded; this processor cannot restrict file capacity.

CE3304A checks that SET_LINE_LENGTH and SET_PAGE_LENGTH raise USE_ERROR if they specify an inappropriate value for the external file; there are no inappropriate values for this processor.

CE3413B checks that PAGE raises LAYOUT_ERROR when the value of the page number exceeds COUNT'LAST; for this processor, the value of COUNT'LAST is greater than 150000, making the checking of this objective impractical.

CXB4001..9 (9 tests) depend on the availability of an interface to COBOL; this processor does not support COBOL interfaces.

CXB5001..5 (5 tests) depend upon the availability of an interface to Fortran; this processor does not support Fortran interfaces.

CXC7003 checks that the Task_attributes operations Set_Value and Reinitialize perform finalization on the old value of the attribute of the specified task. This processor reports Not-Applicable because the implementation limits the allowed size of a task attribute (in instances of Ada.Task_Attributes) to 32 bits.

2.2 MODIFICATIONS

In order to comply with the test objective it may be required to modify the test source code, the test processing method, or the test evaluation method. Modifications are allowable because at the time of test writing not all possible execution environments of the test and the capabilities of the compiler could be foreseen. Possible kinds of modification are:

IMPLEMENTATION DEPENDENCIES

- o Test Modification: The source code of the test is changed.
Examples of test modifications are the insertion of a pragma, the insertion of a representation clause, or the splitting of a B-test into several individual tests, if the compiler does not detect all intended errors in the original test.
- o Processing Modification: The processing of the test by the Ada processor for conformity assessment is changed.
Examples of processing modification are the change of the compilation order for a test that consists of multiple compilations or the additional compilation of a specific support unit in the library.
- o Evaluation Modification: The evaluation of a test result is changed.
An example of evaluation modification is the grading of a test other than the output from REPORT.RESULT indicates. This may be required if the test makes assumptions about implementation features that are not supported by the processor (e.g., the implementation of a file system on a bare target machine).

All modifications have been directed or approved by the ACAA after consulting the ACAL and the customer on the technical justification of the modification. All of the required test modifications from the "ACATS Modifications List", Version 2.2F were used along with any modifications detailed below.

Modifications were required for 38 tests.

The following 29 tests were split into two or more tests because this processor did not report the violations of the Ada Standard in the way expected by the original tests.

B24007A	B29001A	B33201A	B33201C	B33204A
B36201A	B37106A	B37301I	B43201A	B48002A
B48002D	B54A01L	B64003A	B660001	B67001A
B67001B	B67001C	B67001D	B83001D	B83F02C
B95007B	B95081A	BA11005	BA12001	BA12002
BA12004	BA1109A	BC3009C	BC51016	

The following 8 allowable test modifications from the "ACATS Modifications List", Version 2.2F were used.

C390010	CD30004	BXC6A02	BXC6A03	FXC6A00
CXH3001	CXH3003	LXH4014		

IMPLEMENTATION DEPENDENCIES

BXH4004, as directed by the ACAA, was graded passed with the following grading modification:

The test will be graded as PASSED as long as all expected errors are reported, along with an additional error on line 100. (A restriction may cause additional constructs to be rejected. The construct on line 100 violates one of the restrictions given in this test for this implementation.)

2.3 UNSUPPORTED FEATURES OF THE ADA 95 SPECIALIZED NEEDS ANNEXES

As allowed by [Ada95], a processor need not support any of the capabilities specified by a Specialized Needs Annex, or it may support some or all of them. For conformity assessment testing, each set of tests for a particular Annex is processed only upon customer request, but is processed in full (even if the Ada processor provides only partial support). As required by [Ada95], the failure to support a requirement of a Specialized Needs Annex must be indicated by a compile-time rejection or by raising a run-time exception. When a test for a Specialized Needs Annex thus indicates non-support, the result is graded "unsupported" (rather than "inapplicable"). However, if such a test is accepted and reports FAILED, the result is graded "failed", and is considered evidence of non-conformity.

The set of tests for each of the following Specialized Needs Annexes was not processed during this conformity assessment testing:

Annex E, Distributed Systems (all BXE* & CXE* files)
Annex F, Information Systems (all BXF* & CXF* files)
Annex G, Numerics (all CXG* files)

No tests for Annex C, Systems Programming, were graded "unsupported".

No tests for Annex D, Real-Time Systems, were graded "unsupported".

No tests for Annex H, Safety and Security, were graded "unsupported".

CHAPTER 3

PROCESSING INFORMATION

3.1 CONFORMITY ASSESSMENT PROCESS

A full evaluation of the customer's self-tested results was conducted at the ACAL's site.

Witness testing of this Ada processor was conducted at the customer-designated site by a representative of the ACAL.

A CD-ROM containing the customized test suite (see Section 1.3) was taken on-site by the ACAL representative for processing. The contents of the CD-ROM were loaded directly onto the host computer.

After the test files were loaded onto the host computer, the full set of tests was processed by the Ada processor.

The tests were compiled, linked, and executed on the host computer system.

Testing was performed using command scripts provided by the customer and reviewed by the ACAL representative. See Appendix A for a complete listing of the processing options for this processor. Appendix A also indicates the default options.

The following explicit option settings were used during witness testing:

For the compiler, the used options are:

- list : make a listing file
- nowarnings : suppress warning messages

For the linker, the used options are:

- nowarnings : suppress warning messages
- objects cd300051.o : always include object file for the C source needed by impdef for the setting of the constant CD30005_1_Foreign_Address

PROCESSING INFORMATION

Apart from this, the linking of the following tests use special options that were approved by the ACAA:

```
    cxb3013 : -objects cxb30130.o,cxb30131.o      (add needed C objects)

    cxc3001,
    cxc3003,
    cxc3004,
    cxc3006,
    cxc3007,
    cxc3008,
    cxc3009,
    cxda004 : -objects gen_int.o                  (add C object for generation
                                                    of interrupt needed by
                                                    impdefc.a)
```

Test output, compiler and linker listings, and job logs were captured on floppy diskette and archived at the ACAL. The listings examined on-site by the ACAL representative were also archived.

3.2 MACRO PARAMETERS AND IMPLEMENTATION-SPECIFIC VALUES

This section contains the macro parameters used for customizing the ACATS. The meaning and purpose of these parameters are explained in [UG98]. The parameter values are presented in two tables. The first table lists the values that are defined in terms of the maximum input-line length, which is the value for \$MAX_IN_LEN, also listed here. These values are expressed in a symbolic notation, using placeholders as appropriate.

3.2.1 Macro Parameters

Macro Parameter	Macro Value

\$MAX_IN_LEN	255
\$BIG_ID1	AAA ... A1 (255 characters)
\$BIG_ID2	AAA ... A2 (255 characters)
\$BIG_ID3	AAA ... A3A ... A (255 characters)
\$BIG_ID4	AAA ... A4A ... A (255 characters)
\$BIG_STRING1	"AAA ... A" (255/2 characters)
\$BIG_STRING2	"AAA ... A1" ((255/2)-1 characters)
\$BLANKS	" ... " (255-20 blanks)
\$MAX_STRING_LITERAL	"AAA ... A" (255 characters)

```

3.2.2 Package ImpDef and Its Children

The package ImpDef is used by several tests of core language features. Before use in testing, this package is modified to specify certain implementation-defined features. In addition, package ImpDef has a child package for each Specialized Needs Annex, each of which may need similar modifications. The child packages are independent of one another, and are used only by tests for their respective annexes.

This section presents the package ImpDef and each of the relevant child packages as they were modified for this conformity assessment. In the interests of simplifying this ACATR, the header comment block was removed from each of the package files.

3.2.2.1 Package ImpDef

```
-- IMPDEF.A
--
--*
--
-- DESCRIPTION:
--   This package provides tailorable entities for a particular
--   implementation. Each entity may be modified to suit the needs
--   of the implementation. Default values are provided to act as
--   a guide.
--
--   The entities in this package are those which are used in at least
--   one core test. Entities which are used exclusively in tests for
--   annexes C-H are located in annex-specific child units of this package.
--
-- CHANGE HISTORY:
--   12 DEC 93  SAIC    Initial PreRelease version
--   02 DEC 94  SAIC    Second PreRelease version
--   16 May 95  SAIC    Added constants specific to tests of the random
--                     number generator.
--   16 May 95  SAIC    Added Max_RPC_Call_Time constant.
--   17 Jul 95  SAIC    Added Non_State_String constant.
--   21 Aug 95  SAIC    Created from existing IMPSPEC.ADA and IMPBODY.ADA
--                     files.
--   30 Oct 95  SAIC    Added external name string constants.
--   24 Jan 96  SAIC    Added alignment constants.
--   29 Jan 96  SAIC    Moved entities not used in core tests into annex-
--                     specific child packages. Adjusted commentary.
--                     Renamed Validating_System_Programming_Annex to
--                     Validating_Annex_C. Added similar Validating_Annex_?
--                     constants for the other non-core annexes (D-H).
--   01 Mar 96  SAIC    Added external name string constants.
--   21 Mar 96  SAIC    Added external name string constants.
--   02 May 96  SAIC    Removed constants for draft test CXA5014, which was
--                     removed from the tentative ACVC 2.1 suite.
--                     Added constants for use with FXACA00.
```

PROCESSING INFORMATION

```
--      06 Jun 96  SAIC    Added constants for wide character test files.
--      11 Dec 96  SAIC    Updated constants for wide character test files.
--      13 Dec 96  SAIC    Added Address_Value_IO

-- with very few Ada statements before the accept. An implementation is
```

PROCESSING INFORMATION

-- free to specify a delay of several seconds, or even minutes if need be.
-- The main effect of specifying a longer delay than necessary will be an
-- extension of the time needed to run the associated tests.

Switch_To_New_Task : constant Duration := 1.0;
-- ^^^ -- MODIFY HERE AS NEEDED

-- This is the time which will clear the queues of other tasks
-- waiting to run. It is expected that this will be about five
-- times greater than Switch_To_New_Task.

Clear_Ready_Queue : constant Duration := 5.0;
-- ^^^ --- MODIFY HERE AS NEEDED

-- Some implementations will boot with the time set to 1901/1/1/0.0
-- When a delay of Delay_For_Time_Past is given, the implementation
-- guarantees that a subsequent call to Ada.Calendar.Time_Of(1901,1,1)
-- will yield a time that has already passed (for example, when used in
-- a delay_until statement).

Delay_For_Time_Past : constant Duration := 0.1;
-- ^^^ --- MODIFY HERE AS NEEDED

-- Minimum time interval between calls to the time dependent Reset
-- procedures in Float_Random and Discrete_Random packages that is
-- guaranteed to initiate different sequences. See RM A.5.2(45).

Time_Dependent_Reset : constant Duration := 0.3;
-- ^^^ --- MODIFY HERE AS NEEDED

-- Test CXA5013 will loop, trying to generate the required sequence
-- of random numbers. If the RNG is faulty, the required sequence
-- will never be generated. Delay_Per_Random_Test is a time-out value
-- which allows the test to run for a period of time after which the
-- test is failed if the required sequence has not been produced.

PROCESSING INFORMATION

-- time slice unit on implementations which use time slicing. For
-- implementations which do not use time slicing the body can be null.

3.3 WITHDRAWN TESTS

At the time of this conformity assessment testing, the following 1 test was withdrawn from the ACATS.

LA14023

APPENDIX A

COMPILATION SYSTEM OPTIONS AND LINKER OPTIONS

Usage: ada [option ...] source_file_name ...

Compile one or more source texts.

Path Options:

-path file_name{,file_name}	use given path.
-library file_name	use default path associated with the given library

Code Generation Options:

-check check_name=on off [,...]	suppress or unsuppress specified runtime checks Valid check_names: All, Access, Accessibility, Discriminant, Division, Elaboration, Index, Length, Overflow, Range, Storage, Tag
-nocheck	suppress all runtime checks
-core_andf	generate ANDF 4.0
-extended_andf	generate ANDF 4.1 (default)
-debug	generate debug information
-nodebug	don't generate debug information (default)
-install	call ANDF installer (default)
-noinstall	don't call ANDF installer
-keep_primary	keep the primary ANDF capsule in the library (default)
-nokeep_primary	remove the primary ANDF capsule
-optimize class_name=on off [,...]	perform additional optimizations Valid class_names: All, Check, Speed, Size
-nooptimize	don't perform additional optimizations (default)

Compilation Options:

-progress	print progress reports
-noprogess	don't print progress reports (default)
-filename_generation method	
append	append to source file name
change_suffix	change suffix of source file name

COMPILATION SYSTEM OPTIONS AND LINKER OPTIONS

	(default)
-warnings	display warnings (default)
-nowarnings	don't display warnings
-ada83	enforce Ada 83 syntax and semantics
-noada83	Ada 95 syntax and semantics (default)
-verbose	as -progress but more verbose
-noverbose	don't print verbose messages (default)
-analyze	syntax & static semantic checks only
-compile	full compilation (default)
-parse	syntax checks and library storing
-syntax	syntax checks only
-nosyntax	full compilation (default)
-list	make listing file(s)
-nolist	don't make listing file(s) (default)
-lock	lock unit after saving
-nolock	don't lock unit after saving (default)
-recompile	mark units as recompilable (default)
-norecompile	mark units as non recompilable
-filelist	parameters contains names of files to be compiled

Other Options:

-identify	print tool identification, version and active options
-help	print this information and do nothing else

A.2 Linker Options

The linker options of this Ada processor, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this Appendix are to linker documentation and not to this report.

Usage: link_partition [option ...] unit_or_partition_name ...

Link one or more partitions.

Path Options:

-path file_name{,file_name}	use given path.
-library file_name	use default path associated with the given library

Linkage Options:

-adamain	link with an Ada main program (default)
-noadamain	link without an Ada main program
-andf	produce an ANDF capsule
-noandf	produce an executable (default)
-lock	lock partition after writing
-nolock	do not lock partition after writing (default)
-log	output the elaboration order and selected run-time system
-nolog	do not display the elaboration order on standard output (default)
-npx	the target has an NPX floating point unit (default)
-nonpx	the target does not have an NPX floating point unit
-objects file{,file}	additional object files or libraries
-output file_name	name of output file
-nooutput	use the standard name for the output file (default)
-rts file	the the run-time system to use (one is selected by default)
-norts	link without an implied run-time system
-save	save the updated partition (default)
-nosave	do not save the updated partition
-stop_before_link	stop before linking and retain files
-nostop_before_link	do no stop (default)
-target_options "Text"	transfer options to the target linker
-main_priority priority	the default priority of the main task
-task_priority priority	the default priority of tasks being created
-main_stack_size size_in_bytes	the main task stack size
-task_stack_size size_in_bytes	the task stack default size
-task_storage_size size_in_bytes	same as -task_stack_size
-null_stack_size size_in_bytes	the null (idle) task stack size
-reserve_stack_size size_in_bytes	the safety area size in each stack
-task_attr_max_no number	maximum number of simultaneously active task attributes

COMPILATION SYSTEM OPTIONS AND LINKER OPTIONS

-task_attr_size number	maximum size of task attributes in units of 32 bits
-tasks number_of_tasks	maximum number of simultaneous tasks
-template_file template	the linker template file to expand (one is selected by default)
-timer float_value	the timer resolution in seconds
-time_slice float_value	the time_slice in seconds
-ucc ucc_directory_name	the ucc to use (only relevant for bare systems)
-noucc	link without an implied ucc
-ignore_errors	try to link all partitions irrespective of errors
-noignore_errors	stop linking if errors are found (default)
-instance_subunits	only build instance-subunits, don't actually link the partition(s)
-noinstance_subunits	build instance-subunits and link partition(s) (default)
Compilation Options:	
-progress	print progress reports
-noprogess	don't print progress reports (default)
-filename_generation method	
append	append to source file name
change_suffix	change suffix of source file name (default)
-warnings	display warnings (default)
-nowarnings	don't display warnings
Code Generation Options:	
-check check_name=on off [,...]	suppress or unsuppress specified runtime checks Valid check_names: All, Access, Accessibility, Discriminant, Division, Elaboration, Index, Length, Overflow, Range, Storage, Tag
-nocheck	suppress all runtime checks
-core_andf	generate ANDF 4.0
-extended_andf	generate ANDF 4.1 (default)
-debug	generate debug information
-nodebug	don't generate debug information (default)
-install	call ANDF installer (default)
-noinstall	don't call ANDF installer
-keep_primary	keep the primary ANDF capsule in the library (default)
-nokeep_primary	remove the primary ANDF capsule
-optimize class_name=on off [,...]	perform additional optimizations Valid class_names: All, Check, Speed, Size
-nooptimize	don't perform additional optimizations (default)
Other Options:	
-identify	print tool identification, version and active options
-help	print this information and do nothing else

The following pages contain a sample test script.

As an example, the commands for handling of the first class C test, c23001a is shown.

Given that a library, support.alb, exists with the support units compiled into it, a new library, test.alb, is created with visibility to support.alb, which again gives visibility to the so-called root library that contains all predefined units (the names support.alb and test.alb are chosen here for being short and descriptive, these names are not the ones actually used when performing the test under the DDC-I test driver):

```
create_library -parent support.alb test.alb
ADA_LIBRARY=test.alb
export ADA_LIBRARY
```

Remember that \$ADA_LIBRARY is used as the default library in compilations and linkings. Therefore, the library name is not stated explicitly when invoking these tools. Next the source is compiled:

```
ada -nowarnings -list ./src/acvc2_2/c2/c23001a.ada
```

and the partition is linked:

```
link_partition -nowarnings -objects cd300051.o c23001a
```

the executable file is run:

```
c23001a
```

The above commands are not executed directly as is. They are performed by a test driver that executes them by use of various scripts and applications that ensure that:

- the source file extension (.ada, .a, .am, .adt, .dep) is found by lookup in the source directory for each file compiled,
- a looping process is killed after a given time,
- limits on system resources are setup for all processes,
- the exit code of the tools are checked against expectations,
- output is put into log-files and compared against reference material,
- listing files are compared with reference material for e28002b and e28005d,
- libraries are (re)created at appropriate times, e.g. when it has to be ensured that a configuration pragma must only have affect on the test it is meant for,
- information on which tests pass and which fail is collected and displayed.

For example, with the sample commands for handling of c23001a given above:

1) the compilation of the source file is performed under the following constraints:

- 30 seconds CPU time,
- 300 seconds elapsed time,
- created files smaller than 1000 512-byte blocks,

COMPILATION SYSTEM OPTIONS AND LINKER OPTIONS

- 2) after compiling of the source file it is checked that:
 - the compiler exit code is 0,
 - no output is generated to standard output (listing file may be created, of course),
 - no error-message file is generated,
- 3) linking is performed under the following constraints:
 - 30 seconds CPU time,
 - 300 seconds elapsed time,
 - created files smaller than 10000 512-byte blocks,
- 4) after linking it is checked that:
 - the linker exit code is 0,
 - no output is generated to standard output,
- 5) running the executable is performed under the following constraints:
 - 600 seconds CPU time,
 - 600 seconds elapsed time,
 - created files smaller than 10000 512-byte blocks,
 - maximum heap size 1000000 bytes,
- 6) after running the executable it is checked that
 - the exit code is 0,
 - the output is identical to a result that has previously been accepted manually. Only allowed deviation is the date displayed by Report.Test.
- 7) finally, the following cleanup actions are performed:
 - remove the executable file.
